

## HR / ER Series

### 144 / 288 Watt 10:1 DC-DC Converters

The ER/HR Series of DC-DC converters represents versatile power supplies ideally suitable for use in transportation and other advanced electronic systems.

The HR Series converters include a very broad input voltage range, very high efficiency, high reliability, low output voltage noise, and excellent dynamic response to load/line changes.

HR converters can be connected to all conventional railway batteries.

ER Series converters are optimized for connection to 110 V railway batteries.

#### Features

- Extremely wide input voltage range from 12 to 168 VDC in the same converter (HR Series)
- RoHS-compliant for all 6 substances
- Class I equipment
- Compliant with EN 50155, EN 50121, EN 45545
- Input over- and programmable undervoltage lockout
- Shutdown function
- Inrush current limitation
- Interruption time 10 ms
- Adjustable output voltages
- 2 isolated outputs: no load, overload, and short-circuit proof
- Rectangular current limiting characteristic
- Parallel operation with active current sharing
- Very high efficiency up to 94%
- Immunity according to IEC 61000-4-2, -3, -4, -5, -6, -8, -9
- All PCB boards protected by lacquer
- Very high reliability
- 5 year warranty
- Safety-approved to the latest edition of IEC/EN 62368-1 and UL/CSA 62368-1

## Description

The converter inputs are protected against surges and transients. An input over- and undervoltage lockout circuitry disables the outputs, when the input voltage is outside of the specified range. To avoid high input currents at operation with high-voltage batteries, the inhibit input allows for adjusting the undervoltage lockout to a suitable level, thus allowing the use of an appropriate external input fuse.

The converters exhibit an inrush current limiter, preventing external circuit breakers and fuses from tripping at switch-on.

The outputs are open- and short-circuit proof.

Full input-to-output, input-to-case, output-to-case, and output to output isolation is provided. The converters are particularly suitable for railway applications. The HR converters can be supplied by all common railway batteries with 24 V, 36 V, 48 V, 72 V, 96 V, 110 V, and 120 V nominal voltage. The ER converters can be supplied by all common railway batteries with 96 V, 110 V, and 120 V nominal voltage. All PCB boards are coated with a protective lacquer.

The case design allows operation at nominal load up to 71 °C with natural cooling. If forced cooling is provided, the ambient temperature may exceed 71 °C, but the case temperature must remain below 95 °C.

A temperature sensor disables the outputs when the case temperature  $T_c$  exceeds the limit. The outputs are automatically re-enabled, when the temperature drops below the limit.

LED indicators display the status of the converter and allow for visual monitoring of the system at any time.

The converters may either be plugged into a 19" rack system according to IEC 60297-3, or be chassis mounted. Two heat sinks of different size and cooling plates for chassis mounting (option B, B1) are available.

## Model Selection

### Part Number Description

	HR 2 5 40 -9 R B1 G
Operating input voltage $V_{i,cont}$ (continuously):	
16.8 – 150 VDC .....	HR, HRL, HRP
77 – 150 VDC .....	ER, ERL, ERP
Number of outputs .....	2, 7 <sup>2</sup>
Nominal voltage of main output $V_{o1,nom}$	
12 V .....	3
15 V .....	5
48 V .....	8
Other voltages <sup>1</sup> .....	9
Nominal voltage of tracking output $V_{o2}$ <sup>3</sup>	
12 V .....	20
15 V .....	40
48 V .....	80
Other specifications or additional features <sup>1</sup> .....	21 – 99
Operational temperature range: $T_A$ :	
$T_A = -40$ to $71$ °C, $T_C \leq 95$ °C .....	-9
Other <sup>1</sup> .....	-0, -5, -6
Auxiliary functions and options:	
Output voltage control input .....	R
Cooling plate standard case .....	B, B1
Cooling plate for long case 220 mm <sup>2</sup> .....	B2 <sup>2</sup>
RoHS-compliant for all 6 substances .....	G <sup>4</sup>

- <sup>1</sup> Customer-specific models. No safety-relevant changes compared to the respective basic model, e.g. different mechanical details, special markings, mounted front plates, reduced output voltage, etc.
- <sup>2</sup> Converters with 220 mm case (customer-specific models). Add 5000 to the model number, e.g. HR2540-9RB1G → HR7540-9RB1G.
- <sup>3</sup> The nominal voltages of both outputs are always equal.
- <sup>4</sup> G is always placed at the end of the part number.

**Note:** The sequence of options must follow the order above.

**Example:** HR2540-9RB1G: DC-DC converter, operating input voltage range 16.8 – 150 VDC, 2 isolated outputs, each providing 15 V, 8 A, control input R to adjust the output voltages, cooling plate B1, and RoHS-compliant for all six substances.

### Product Marking

Basic type designation, approval marks, CE mark, warnings, pin allocation, patents, MELCHER logo, specific type designation, input voltage range, nominal output voltages and output currents, degree of protection, identification of LEDs, batch no., serial no. and data code including production site, version, and production date.

### Functional Description

The input voltage is fed via an efficient filter to the interleaved switching boost converter (HR models), which provides the intermediate circuit voltage on the bulk capacitor  $C_b$ . The inrush current is limited by the resistor  $R_{inr}$ , which is shorted by  $V_{inr}$  after the bulk capacitor was charged.

The bulk capacitor sources a single-transistor forward converter with active clamp and provides the power during the interruption time of 10 ms.

The main transformer exhibits two separate secondary windings for the two outputs. The resultant voltages are rectified by synchronous rectifiers (not models with  $V_o = 2 \times 48 V$ ) in order to provide the best efficiency. Their ripple voltages are smoothed by a dual power choke and output filters. The control logic senses the main output voltage  $V_{o1}$  and generates the control signal for the forward converter, with respect to the max. output current transferred via magnetic feedback to the control circuit of the forward converter, located on the primary side.

The second output voltage is tracking the main output, but has its own current limiting circuit. If the main output voltage drops due to current limitation, the second output voltage will drop as well and vice versa.

The output voltages can be adjusted by external means. Parallel operation of several converters is possible by interconnecting the T-pins to provide active current sharing. Both outputs can be connected in parallel or in series without any precaution. They exhibit a rectangular current limitation characteristic. Switchable preloads  $V_{PL}$  (Version V101 or later) ensure good regulation even with no load at one output.

A control output (D) and two LEDs signal correct operation of the converter. In case of an output overvoltage, the converter is disabled by a latch.

Input over- and undervoltage lockout is provided. The undervoltage trigger level can be adjusted by an external resistor connected to PUL (pin 24) depending on the nominal voltage of the supplying battery.

Temperature sensors on the primary and secondary side prevent the converter from excessive warm-up.

A cooling plate for chassis-mounting is available (opt. B, B1).

### Electrical Input Data

General conditions:

- $T_A = 25\text{ °C}$ , unless  $T_C$  is specified.
- Pin 24 (PUL) left open-circuit
- Pin 16 (R) and 18 (D) left open-circuit.

<sup>2</sup> According to ETS 300132-2

**PUL Function and Fuse**

No fuse is incorporated in the converters. Consequently, an external fuse or a circuit breaker must be installed at system level to protect against severe defects.

HR converters are designed for an extremely wide input voltage range, allowing for connection to all common railway batteries. However, the programmable input undervoltage lockout (PUL, pin 24) should be adjusted adequately, in order to limit the input current at low input voltage.

Table 3 specifies the values of the resistor  $R_{PUL}$ , connected between PUL and  $V_{i-}$ , versus the resultant minimum input voltage and the recommended external input fuse.

Fig. 3 shows more values of  $R_{PUL}$  versus start-up voltage. For stationary batteries, a higher start-up voltage might be advantageous.

Fig. 3  $R_{PUL}$  versus switch-on voltage (HR models)

ER models are designed for the input voltage range of a 110 V railway battery. The input undervoltage lockout (PUL, pin 24) may be adjusted if requested. The PUL resistors are specified in table 4.

Table 3: PUL Specification (typ.) and recommended external fuses for HR/HRP models. Smaller fuses are possible for HRL models.

Battery	$R_{PUL}$	$V_{i min}$ (on / off)		Fuse recommended <sup>4</sup>
24 V	$\infty$	15 V	12 V <sup>3</sup>	25 A fast, Littlefuse 314 <sup>1</sup>
36 V	16.9 k $\Omega$	20 V	18 V	16 A fast, Schurter / SP <sup>2</sup>
48 V	13.7 k $\Omega$	26 V	20 V	12.5 A fast, Schurter / SP <sup>2</sup>
72 V	9.5 k $\Omega$	38 V	32 V	8 A fast, Schurter / SP <sup>2</sup>
96 V	5.2 k $\Omega$	62 V	57 V	6.3 A slow, BEL fuse MRT <sup>2</sup>
110 V	2.9 k $\Omega$	90 V	84 V	5.0 A slow, BEL fuse MRT <sup>2</sup>
all	< 100 $\Omega$	Converter disabled		

Table 4: PUL specification (typ.) and recommended external fuses for ER/ERP models. Smaller fuses are possible for ERL models.

Battery	$R_{PUL}$	$V_{i min}$ (on / off)		Fuse recommended <sup>4</sup>
110 V	5.0 k $\Omega$	64.5 V	60.5 V	6.3 A slow, BEL fuse MRT <sup>2</sup>
110 V	4.0 k $\Omega$	74.5 V	69 V	6.3 A slow, BEL fuse MRT <sup>2</sup>
110 V	3.0 k $\Omega$	87.4 V	81.6 V	6.3 A slow, BEL fuse MRT <sup>2</sup>
110 V	2.5 k $\Omega$	96 V	90 V	6.3 A slow, BEL fuse MRT <sup>2</sup>
120 V	2.2 k $\Omega$	101.7 V	96 V	5.0 A slow, BEL fuse MRT <sup>2</sup>
-	< 100 $\Omega$	Converter disabled		

<sup>1</sup> fuse size 6.3 x 32 mm <sup>2</sup> fuse size 5 x 20 mm <sup>3</sup> for  $\leq 2$  s

<sup>4</sup> If the converter is not supplied from battery voltage but from other DC source within its operating range, use fuse rating of 25 A fast (e.g. Littlefuse 314)

**Note:** If PUL (pin 24) is connected to  $V_{i-}$  (pin 30/32), the converter is disabled; see *Inhibit Function*.

Fig. 4 and 5 show the input current versus the input voltage.

**Reverse Polarity and Input Transient Protection**

Reverse polarity protection of all models is provided by an antiparallel diode across the input, causing the external input fuse or circuit breaker to trip. ER models exhibit an additional serial diode on the input.

The double stage symmetrical input filter together with a VDR (voltage depending resistor) form an effective protection against high input transient voltages, which typically occur in battery-driven mobile applications.

At very high input voltage, the overvoltage lockout disables the converter in order to protect it from damage.

**Inrush Current Limitation**

The converters exhibit an electronic inrush current limiting circuit. This circuit is also functional, when the input voltage is removed and immediately reapplied.

However, several capacitors are directly connected to the input pins. Consequently, a short current peak is present, when applying the input voltage.

The inrush current peak value can be determined by following calculation; see also fig. 6:

$$I_{inr p} = \frac{V_{i source}}{(R_{ext} + R_i)}$$

Fig. 6  
Equivalent input circuit

Fig. 7  
Inrush current at  $V_i = 150 V$ ,  $I_{o nom}$  (HR2320, ER2320)

**Efficiency**

**Thermal Considerations**

If a converter is located in free, quasi-stationary air (convection cooling) at the indicated maximum ambient temperature  $T_{A\text{max}}$  (see table *Temperature specifications*) and is operated within the specified input voltage range and nominal load, the temperature measured at the *Measuring point of case temperature*  $T_C$  (see *Mechanical Data*) will approach the indicated value  $T_{C\text{max}}$  after the warm-up phase. However, the relationship between  $T_A$  and  $T_C$  depends heavily upon the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow, and temperature of surrounding components and surfaces.  $T_{A\text{max}}$  is therefore, contrary to  $T_{C\text{max}}$ , an indicative value only; see also fig. 9.

Fig. 9 Power derating for HRP/HR/HRL2320

**Caution:** The installer must ensure that under all operating conditions  $T_C$  remains within the limits stated in the table *Temperature specifications*.

**Notes:** Sufficient forced cooling or enhanced cooling with the help of cooling plates (options B, B1) allows for  $T_A$  to be higher than 71 °C (e.g. 85 °C), as long as  $T_{C\text{max}}$  is not exceeded.

powersupport@belf.com  
belfuse.com/power-solutions

### Thermal Protection

Two temperature sensors generate an internal inhibit signal, which disables the converter in the case of overtemperature. The outputs automatically recover when the temperature drops below the limit.

### Interruption Time

The integrated storage capacitor ( $C_b$ ) is loaded to the boost voltage and ensures full output voltage with nominal load during an interruption time (or ride-through time) of at least 10 ms, provided that  $V_i$  was  $\geq 20$  V before the interruption. This complies with EN 50155:2017 class S2.

### Output Protection

The 2<sup>nd</sup> output of double-output models is protected by a suppressor diode against overvoltage, which could occur due to a failure of the internal control circuit. This suppressor diode was not designed to withstand externally applied overvoltages. Overload at any of the outputs will cause both outputs to shut down.

**Note:**  $V_{oBR}$  of the suppressor diode is specified in *Electrical Output Data*. If this voltage is exceeded, the suppressor diode generates losses and may become a short circuit.

**Note:** The output voltage of the first output is monitored. If it exceeds typ. 140% of  $V_{o,nom}$  for 10 ms, the converter is inhibited. To reactivate,  $V_i$  must be removed or an inhibit signal must be applied to PUL (pin 24).

Each output has its own current limiting circuit, providing a rectangular output characteristic and protecting against short circuit. There is no limitation for the capacitive load, and battery charging is possible as well.

**Series and Parallel Connection**

Both outputs of the same converter can be series-connected or parallel-connected in order to double the output current or the output voltage respectively.

Outputs of different converters may be series-connected.

In parallel connection of several converters, the T-pins should be interconnected so that all converters share the output current equally; see fig. 10. HRL and ERL models have no T-pins and should not be operated in parallel connection.

If both outputs of each converter are connected in series, Vo1- of both converters should be connected together and the T-pins as well. See fig. 11.

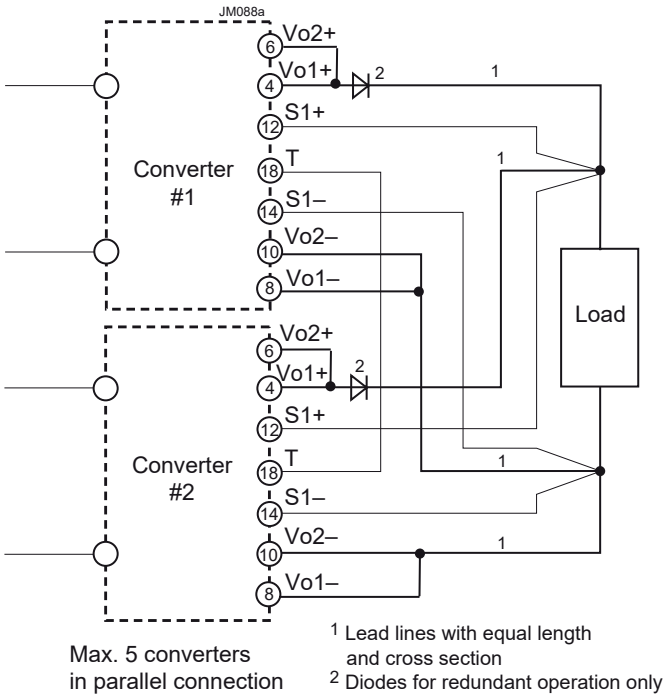

Fig. 10 Parallel connection with OR-ing diodes and sense lines connected at the load

Fig. 11 Parallel connection of double-output models with the outputs of each converter connected in series, using option T. The signal at the T pins are referenced to Vo1-.

**Notes:**

- Not more than 5 converters should be connected in parallel.
- If several outputs are connected in series, the resulting voltage can exceed the ES1 level.
- The PUL-pins (pin 24) should exhibit an individual PUL resistor for each converter. If the shutdown function is used, each PUL-pin must be controlled individually.
- The R-pins should be left open-circuit. If not, the output voltages must individually be adjusted prior to paralleling within 1 to 2% or the R-pins should be connected together.
- Series connection of second outputs without involving their main outputs should be avoided, as regulation may be poor.

**Output Voltage Regulation**

If both outputs are connected in parallel or in series, the converter exhibits a rectangular output characteristic; see fig. 12. The typ. dynamic load regulation illustrates fig. 13.

Fig. 12  
Output characteristic  $V_o$  versus  $I_o$   
(both outputs connected in parallel or in series)

Fig. 13  
Typical dynamic load regulation of  $V_o$ .

Output 1 is under normal conditions regulated to  $V_{o nom}$ , irrespective of the output currents.

However,  $V_{o2}$  depends upon the load distribution; see fig. 14 a and fig. 14b. Converters with version V101 (or later) have incorporated switchable preloads and do not need a minimum load.

**Note:** If output 2 is not used, connect it with output 1 ! This ensures good voltage regulation and efficiency.

Fig. 14a  
Models HR/ER2320:  $V_{o2}$  versus  $I_{o2}$  with various  $I_{o1}$

Fig. 14b  
Models HR/ER2880:  $V_{o2}$  versus  $I_{o2}$  with various  $I_{o1}$

## Auxiliary Functions

### Inhibit Function

The PUL input (pin 24) can also be used as inhibit (for the PUL function see table 3 and 4). The response time  $t_{on}$  and the rise time  $t_r$  are specified in table 2.

The current coming out from pin 24 (PUL) is typ. 1.5 mA (<2 mA). If pin 24 is left open-circuit, the voltage is typ. 5 V. The converter is disabled when  $V_{PUL}$  is  $\leq 500$  mV.

**Note:** Inhibit must be referenced directly to Vi- (Pin 30, 32). Do not connect it to battery side of main circuit breaker.

Fig. 15 Typical output response to the PUL-signal (inhibit)

Fig. 16 Circuit for the inhibit function

### Current Share Function

If the pins 18 (T) of parallel-connected converters are connected together, the converters share the output current evenly. Refer to section *Parallel and Series Connection*. Not for HRL and ERL models.

### Sense Lines

This feature allows for compensation of voltage drops across the connector contacts and if necessary, across the load lines. We recommend connecting the sense lines directly at the female connector.

To ensure correct operation, both sense lines (S1+, S1-) should be connected to their respective power outputs (Vo1+ and Vo1-), and the voltage difference between any sense line and its respective power output (as measured on the connector) should not exceed the values specified in table 6.

Table 6: Maximum voltage compensation allowed using sense lines

Output voltage	Total voltage difference between sense lines and their respective outputs	Voltage difference between Vo1- and S1-
12 V	< 1.00 V	< 0.5 V
15 V	< 1.25 V	< 0.6 V
48 V	< 2.00 V	< 1.0 V

**Important:** Sense lines should be connected! Incorrectly connected sense lines may activate the overvoltage protection resulting in a permanent short-circuit of the output. Open sense lines are allowed, but result in inaccurate output voltages.

**Output Voltage Adjust**

As a standard feature, the converters offer an adjustable output voltage. The control input R (pin 16) accepts either a control voltage  $V_{ext}$  or a resistor  $R_{ext}$  to adjust the output voltage. When input R is not connected, the output voltage is set to  $V_{o,nom}$ .

a) Adjustment by means of an **external control voltage  $V_{ext}$**  between pin 16 (R) and pin 14 (S1-):

The control voltage range is 1.0 – 2.875 V and allows for an adjustment in the range of approx. 40 – 115% of  $V_{o,nom}$ .

$$V_{ext} \approx \frac{V_o \cdot 2.5 V}{V_{o,nom}}$$

**Caution:** Applying an external control voltage >2.875V may damage the converter.

b) Adjustment by means of an **external resistor:**

Depending on the value of the required output voltage, the resistor shall be connected

**either:** between pin 16 (R) and pin 14 (S1-) to adjust the output voltage in the range of approx. 40 – 100% of  $V_{o,nom}$ ,

$$R_{ext1} \approx 4 k\Omega \cdot \frac{V_o}{V_{o,nom} - V_o}$$

**or:** between pin 16 (R) and pin 12 (S1+) to adjust the output voltage in the range of 100 – 115% of  $V_{o,nom}$ .

$$R_{ext2} \approx 4 k\Omega \cdot \frac{(V_o - 2.5 V)}{2.5 V \cdot (V_o/V_{o,nom} - 1)}$$

**Caution:** To prevent the converter from damage, the value of  $R'_{ext}$  shall never be less than the value for increasing  $V_{o1}$  to 115% !

Fig. 17  
Output voltage adjustment

**Notes:**

- If the output voltages are increased above  $V_{o,nom}$  via R-input control, sense lines, or option T, the output currents should be reduced, so that  $P_{o,nom}$  is not exceeded.
- The second output of double-output models follows the voltage of the controlled main output.

**Output Voltage Monitor**

The output voltage monitor generates a logic “low” signal (NPN open-collector output) at the D-output (pin 20), when  $V_{o1} \geq 0.96 V_{o,nom}$ . For converters with version V101 (or later), the voltage at S1+ (corresponding to  $V_{o1}$ ) must be  $\geq 0.96 V_{o,nom}$  and  $\leq 1.04 V_{o,nom}$  (typ. values). Then, a green LED (Out OK) at the frontplate is illuminated. If the output voltage is adjusted by the R-input, the trigger levels are corrected accordingly.

At low D-output, the current is limited by a 10 Ω protective resistor; for converters with Version V102 (or later)  $I_D$  should be  $\leq 100$  mA. If the D-output is high (open collector),  $V_D$  should be  $\leq 75$  V. For previous converters:  $\leq 50$  mA and 50 V.

**Note:** Output overvoltage activates a latch; see *Output Protection*.

Fig. 18  
Output voltage monitor

**Indicators**

Two green LED indicators are visible at the front plate:

- Out OK; see *Output Voltage Monitor*
- In OK. This signal is activated when  $V_i$  is below 158 V and greater than  $V_{i\min}$ , whereas  $V_{i\min}$  is defined by the adjust resistor connected to the PUL input (pin 24).

**Battery Charging / Temperature Sensor**

All converters with an R-input are suitable for battery charger application. For optimal battery charging and life expectancy of the battery an external temperature sensor can be connected to the R-input. The sensor is mounted as close as possible to the battery and adjusts the output voltage according to the battery temperature.

Depending upon cell voltage and the temperature coefficient of the battery, different sensor types are available; see *Accessories*.

Fig. 19  
Connection of a temperature sensor

Fig. 20  
Trickle charge voltage versus temperature for defined temp. coefficient.  $V_{o\text{nom}}$  is the output voltage with open R-input.

## Electromagnetic Compatibility (EMC)

A metal oxide VDR together and an efficient input filter form an effective protection against high input transient voltages, which typically occur in most installations. The converters have been successfully tested to the following specifications:

### Electromagnetic Immunity

Table 7: Electromagnetic immunity (type tests)

Phenomenon	Standard	Level	Coupling mode <sup>1</sup>	Value applied	Waveform	Source imped.	Test procedure	In oper.	Perf. crit. <sup>2</sup>

<sup>1</sup> i = input, o = output, c = case

<sup>2</sup> A = normal operation, no deviation from specs.; B = normal operation, temporary loss of function or deviation from specs possible

<sup>3</sup> Exceeds EN 50121-3-2:2016 table 5.3 and EN 50121-4:2016 table 2.4.

<sup>4</sup> Corresponds to EN 50121-3-2:2016 table 5.1 and exceeds EN 50121-4:2016 table 2.1.

<sup>5</sup> Corresponds to EN 50121-3-2:2016 table 5.2 and EN 50121-4:2016 table 2.2 (compliance with digital communication devices).

<sup>6</sup> Corresponds/exceeds EN 50121-3-2:2016 table 3.2 and EN 50121-4:2016 table 4.2.

<sup>7</sup> Covers EN 50121-3-2:2016 table 5.3 and EN 50121-4:2016 table 4.3.

<sup>8</sup> Corresponds to EN 50121-3-2:2016 table 3.1 and EN 50121-4:2016 table 4.1 (radio frequency common mode).

<sup>9</sup> Corresponds to EN 50121-4:2016 table 2.3.

**Electromagnetic Emissions**

All conducted emissions (fig. 21 and 22) have been tested according to EN 55011, group 1, class A. These limits are much stronger than requested in EN 50121-3-2:2016, table 2.1, and coincide with EN 50121-4:2016, table 1.1. The limits in fig. 21 and 22 apply to quasipeak values, which are always lower than peak values.

In addition, the values for average must hold a limit 10 dBµV below the limits in fig. 21 and 22 (not shown).

Radiated emissions have been tested according to EN 55011, group 1, class A. These limits are similar to the requirements of EN 50121-3-2:2016 and EN 50121-4:2016, both calling up EN 61000-6-4+A1:2011, table 1. The tests were executed with horizontal and vertical polarization. The worse result is shown in fig. 22 and 23.

**Fig. 21**  
Typ. conducted emissions (peak/quasipeak and average) at the input, measured at  $V_i = 24\text{ V}$  and  $I_{o,nom}$  (HR2320-9RG).

**Fig. 22**  
Typ. conducted emissions (peak/quasipeak and average) at the input, measured at  $V_i = 110\text{ V}$  and  $I_{o,nom}$  (HR2320-9RG, ER2320-9RG).

**Fig. 23**  
Typ. radiated emissions in 10 m distance, measured at  $V_i = 24\text{ V}$  and  $I_{o,nom}$  (HR2320-9RG).

**Fig. 24**  
Typ. radiated emissions in 10 m distance, measured at  $V_i = 110\text{ V}$  and  $I_{o,nom}$  (HR2320-9RG, ER2320-9RG).

## Immunity to Environmental Conditions

Table 8: Mechanical and climatic stress

Test method		Standard	Test Conditions	Status
Cab	Damp heat steady state	IEC/EN 60068-2-78 MIL-STD-810D section 507.2	Temperature: 40 <sup>±2</sup> °C Relative humidity: 93 <sup>+2/-3</sup> % Duration: 56 days	Converter not operating
Db 2	Cyclic damp heat test	EN 50155:2017, clause 13.4.7 IEC/EN 60068-2-30	Temperature: 55 °C and 25 °C Cycles (respiration effect) 2 Duration: 2x 24 h	Converter not operating
Be	Dry heat test steady state	EN 50155:2017, clause 13.4.5 IEC/EN 60068-2-2	Temperature: 70 °C Duration: 6 h	Converter operating
Ad	Low temperature start-up test	EN 50155:2017, clause 13.4.4 IEC/EN 60068-2-1	Temperature, duration: -40 °C, 2 h Performance test: +25 °C	Converter not operating
Ka	Salt mist test sodium chloride (NaCl) solution	EN 50155:2017, clause 13.4.10	Temperature: 35 <sup>±2</sup> °C Duration: 48 h	Converter not operating
Fc	Vibration (sinusoidal)	IEC/EN 60068-2-6 MIL-STD-810D section 514.3	Acceleration amplitude: 0.35 mm (10 – 60 Hz) 5 g <sub>n</sub> = 49 m/s <sup>2</sup> (60 - 2000 Hz) Frequency (1 Oct/min): 10 – 2000 Hz Test duration: 7.5 h (2.5 h in each axis)	Converter operating
Fh	Random vibration broad band (digital control) & guidance	IEC/EN 60068-2-64	Acceleration spectral density: 0.05 g <sub>n</sub> <sup>2</sup> /Hz Frequency band: 8 – 500 Hz Acceleration magnitude: 4.9 g <sub>n,rms</sub> Test duration: 1.5 h (0.5 h in each axis)	Converter operating
Ea	Shock (half-sinusoidal)	IEC/EN 60068-2-27 MIL-STD-810D section 516.3	Acceleration amplitude: 50 g <sub>n</sub> = 490 m/s <sup>2</sup> Bump duration: 11 ms Number of bumps: 18 (3 in each direction)	Converter operating
-	Shock	EN 50155:2017 clause 13.4.11, EN 61373:2010 sect. 10, class B, body mounted <sup>1</sup>	Acceleration amplitude: 5.1 g <sub>n</sub> Bump duration: 30 ms Number of bumps: 18 (3 in each direction)	Converter operating crit. A
-	Simulated long life testing at increased random vibration levels	EN 50155:2017 clause 13.4.11.2, EN 61373:2010 sect. 8 and 9, class B, body mounted <sup>1</sup>	Acceleration spectral density: 0.02 g <sub>n</sub> <sup>2</sup> /Hz Frequency band: 5 – 150 Hz Acceleration magnitude: 0.8 g <sub>n,rms</sub> Test duration: 15 h (5 h in each axis)	Converter operating crit. A

<sup>1</sup> Body mounted = chassis of a railway coach

## Temperatures

Table 9: Temperature specifications, valid for an air pressure of 800 – 1200 hPa (800 – 1200 mbar)

Model		-9			Unit
Characteristics		min	typ	max	
T <sub>A</sub>	Ambient temperature	Converter operating		- 40	° C
T <sub>C</sub>	Case temperature			71 <sup>1</sup>	
T <sub>S</sub>	Storage temperature	Not operational		- 40	
				- 55	85

<sup>1</sup> See *Thermal Considerations*.

<sup>2</sup> Overtemperature lockout at T<sub>C</sub> > 95 °C (An NTC resistor on primary and secondary heatsink).

Reliability

Table 10: MTBF and device hours

Ratings at specified case temperature	Model	Ground benign	Ground fixed		Ground mobile	Life test <sup>1</sup>	Device hours <sup>2</sup>	Unit
		40 °C	40 °C	70 °C	50 °C	25 °C		
Bellcore SR332	HR2320	352 000	176 000	49 000	38 000	500 000		h

<sup>1</sup> Life test with 32 converters during 26 days, cycling at 60 °C; confidence level 60%.

<sup>2</sup> Statistical values, based on an average of 4300 working hours per year and in general field use over 5 years; upgrades and customer-induced errors are excluded.

Mechanical Data

Dimensions in mm. The converters are designed to be inserted into a 19" rack, 160 mm long, according to IEC 60297-3.

Fig. 25  
Case S03 for HR / ER and HRL / ERL models with heat sink;  
Aluminum, black finish (EP powder coated);  
weight approx. 1.5 kg

Notes:

- $d \geq 15$  mm, recommended minimum distance to next part in order to ensure proper air circulation at full output power and free convection cooling.
- free air location: the converter should be mounted with fins in a vertical position to achieve maximum airflow through the heat sink.

Dimensions in mm. The converters are designed to be inserted into a 19" rack, 160 mm long, according to IEC 60297-3.

Fig. 26  
Case K03 for HRP and ERP models with heat sink;  
Aluminum, black finish (EP powder coated);  
weight approx. 1.8 kg

**Notes:**

- $d \geq 15$  mm, recommended minimum distance to next part in order to ensure proper air circulation at full output power and free convection cooling.
- free air location: the converter should be mounted with fins in a vertical position to achieve maximum airflow through the heat sink.

Fig. 27  
 Option B: Aluminum case S03 with large cooling plate; black finish (EP powder coated).  
 Suitable for front mounting.  
 Total weight approx. 1.5 kg

**Note:** Long case with option B2, elongated by 60 mm for 220 mm rack depth, is available on request. (No LEDs)

Fig. 28  
 Option B1: Aluminum case S03 with small cooling plate; black finish (EP powder coated).  
 Suitable for mounting with access from the backside.  
 Total weight approx. 1.4 kg.

## Safety and Installation Instructions

### Connector Pin Allocation

The connector pin allocation table defines the electrical potentials and the physical pin positions on the H15 connector. The protective earth is connected by a leading pin (no. 24), ensuring that it makes contact with the female connector first.

Fig. 29  
View of module's male connectors

Table 11: Pin allocation

Pin	Name	Function
4	Vo1+	Output 1 positive
6	Vo2+	Output 2 positive
8	Vo1-	Output 1 negative
10	Vo2-	Output 2 negative
12	S1+	Sense line positive
14	S1-	Sense line negative
16	R	Output voltage adjust
18 <sup>2</sup>	T	Current share
20	D	Out OK
22 <sup>1</sup>	PE	Protection earth $\oplus$
24	PUL	Programmable undervoltage lockout
26 + 28	Vi+	Input positive
30 + 32	Vi-	Input negative

<sup>1</sup> Leading pin (pre-connecting)

<sup>2</sup> Not connected for HRL / ERL models

### Installation Instructions

The converters are components, intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. Installation must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings, and segregation requirements of the end-use application.

Connection to the system shall be made via the female connector H15; see *Accessories*. Other installation methods may not meet the safety requirements.

Pin no. 22 ( $\oplus$ ) is connected with the case. For safety reasons it is essential to connect this pin reliably to protective earth.

**Notes:**

- The PUL function (pin 24) must be programmed to enable the outputs. PUL should be connected to Vi– (pins 30 + 32) by a resistor to adjust the start-up voltage; see table 3. Otherwise, the input current may become too high at low input voltage.
- Do not open the converter, or warranty will be invalidated.
- If the second output is not used, connect it in parallel with the main output.

Make sure that there is sufficient airflow available for convection cooling and verify it by measuring the case temperature  $T_c$ , when the converter is installed and operated in the end-use application; see *Thermal Considerations*.

Ensure that a converter failure (e.g. an internal short-circuit) does not result in a hazardous condition.

## Standards and Approvals

The converters are safety-approved to UL/CSA 62368-1 3rd edition and IEC/EN 62368-1 3rd edition.

The converters correspond to Class I equipment (with case connected to ground). They have been evaluated for:

- Building-in
- Basic insulation between input and case based on 250 VA. Double or reinforced insulation between input and outputs
- Functional insulation between outputs
- Overvoltage category II
- Pollution degree 2 environment
- Max. altitude: 2000 m
- The converters fulfill the requirements of a fire enclosure.

The output voltage is considered as ES1, except HR/HRP/ER/ERP2880 with both outputs in series connection.

The converters are subject to manufacturing surveillance in accordance with the above mentioned safety standards and with ISO 9001:2015, IRIS ISO/TS 22163:2017 certified quality and business management system. CB-scheme is available on request.

## Protection Degree and Cleaning Liquids

The protection degree is IP 40, provided that the female connector is fitted to the converter.

In order to avoid possible damage, any penetration of cleaning fluids has to be prevented, since the power supplies are not hermetically sealed.

## Railway Application and Fire Protection

The converters have been designed by observing the railway standards EN 50155, EN 50121-3-2, and EN 50121-4. All boards are coated with a protective lacquer.

The converters comply with NF-F16 (I2/F1). They also comply with EN 45545-1, EN 45545-2, if installed in a technical compartment or cabinet.

## Isolation and Protective Earth

The electric strength test is performed in the factory as routine test according to EN 62911 and IEC/EN 62368-1 and should not be repeated in the field. The Company will not honor warranty claims resulting from incorrectly executed electric strength tests. The resistance case to the earth pin ( $<0.1 \Omega$ ) is tested with 25 A for 1 s.

Table 12: Isolation

Characteristics		Input to Case + Outputs	Output(s) to Case	Output 1 to Output 2	Unit
Electric strength test	Factory test 10 s	2.8 <sup>1</sup>	1.4	0.3	kVDC
	AC test voltage equivalent to factory test	2.0	1.0	0.21	kVAC
Insulation resistance		>300	>300	>100 <sup>2</sup>	MΩ
Creepage distances		≥ 2.8 <sup>3</sup>	≥ 2.5	-	mm

<sup>1</sup> Subassemblies connecting input to output are pre-tested with 5.0 kVDC or 3.5 kVAC.

<sup>2</sup> Tested at 150 VDC

<sup>3</sup> Input to outputs: 5.0 mm

## Description of Options

### B, B1 Cooling Plates

Where a cooling surface is available, we recommend the use of a cooling plate instead of the standard heat sink. The mounting system should ensure that the maximum case temperature  $T_{C_{max}}$  is not exceeded. The cooling capacity is calculated by ( $\eta$  see *Model Selection*):

$$P_{Loss} = \frac{(100\% - \eta)}{\eta} \cdot V_o \cdot I_o$$

For the dimensions of the cooling plates; see *Mechanical Data*.

## Accessories

A variety of electrical and mechanical accessories are available including:

- Front panels for 19" DIN-rack: Schroff or Intermas, 12 or 16 TE / 3U; see fig. 30 and the data sheet BCD.00495.
- Mating H15 connectors with screw, solder, faston, or press-fit terminals; see fig. 31
- Coding clips for connector coding HZZ00202
- Pair of connector retention clips HZZ01209-G; see fig. 32
- Connector retention brackets HZZ01216-G; see fig. 33
- Cage clamp adapter HZZ00144-G; see fig. 34
- Cable hood for H15 connectors (fig 35):
  - HZZ00143-G, HZZ00153-G, metallic version providing fire protection
- Wall-mounting plate K02 (HZZ01213-G) for models with option B1; see fig. 36
- DIN-rail mounting assembly HZZ0615-G (DMB-K/S); see fig. 37
- Additional external input and output filters
- Different battery sensors S-KSMH... for using the converter as a battery charger. Different cell characteristics can be selected; see fig. 38, table 13, and *Battery Charging/Temperature Sensors*.

For additional accessory product information, see the accessory data sheets listed with each product series or individual model at our web site [belfuse.com/power-solutions](http://belfuse.com/power-solutions).
